Japan

# Timeline

3 months???  
Domestic coordination,  
Prepare API filing, etc.

ITU Frequency Coordination  
12 months.  
(possibly shorter or longer...)

Earth Station Radio License  
6 months.  
(possibly shorter or longer...)

Launch!  
3 months.

## Timeline

Total 2 years journey!

.....When do you plan to launch?

## Filing API for coordination

Before the filing API for satellite, the following parameters and considerations are needed to be studied:

- Modulation Type
  - Correct modulation type needs to be filed
- Frequency Range/Bandwidth
  - The Wider the frequency range and/or bandwidth, the greater the number of countries required for coordination, which will consume greater time
  - If the frequency range is set to too narrow, it may introduce difficulty in interference coordination with existing radio services / stations locally
  - Only allow to alter the frequency within the range filed
  - Care should be taken when decides frequency range
- Type of Service
  - Type of service should match with the one defined in ITU frequency allocation on designated region
- Ground Station Coordination
  - API filing should include technical information of ground station to be used for service
  - Separate filing should take in place for ground station frequency coordination with affecting foreign radio regulatory bodies where ground station will be located (RR9.15, 9.17)

## Questions often asked

Q: If ITU filing doesn't include a country or Ground Station to be used?

A: Most probably Earth Station licensing process cannot be started.

Q: Should I include service area countries or Ground Stations as many as possible?

A: If you have more included, coordination may take longer. However, any country or ground station needs to be included if there is a chance to be used.

Q: Which country is easy to get a license?

A: Case-by-case. Your satellite mission and frequency to be used are mostly affected parameters.

**Satellite operator need to decide which Ground Station to be included in your ITU filing.**

More Details...

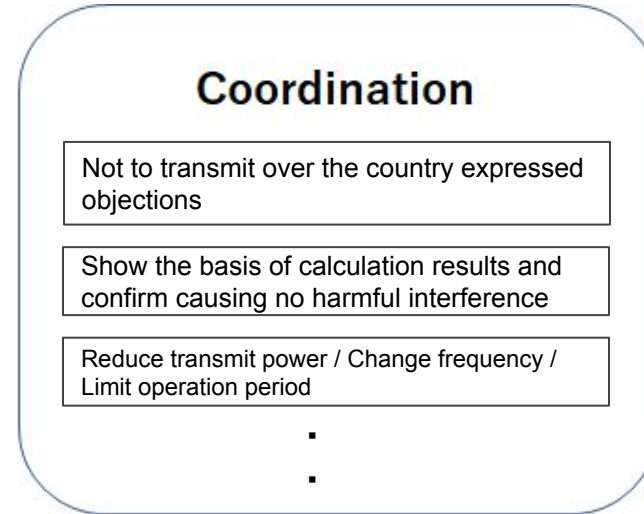

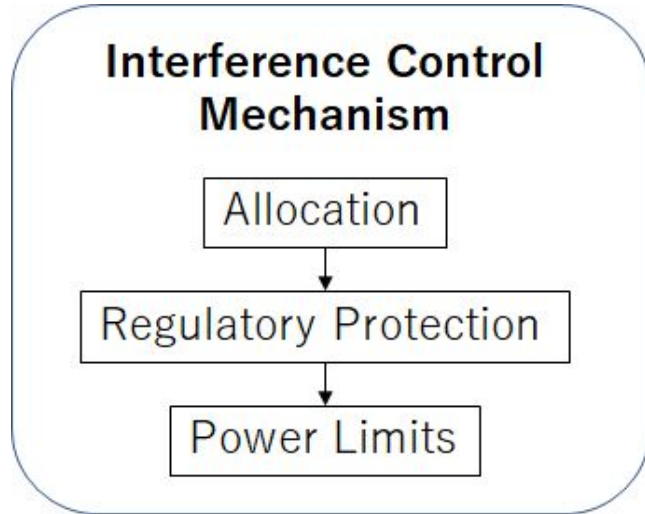

### Frequency Coordination Service

- Radio frequencies and orbits are considered as limited natural resources
- Any service operator using radio spectrum needs to limit the spectrum used to the bare minimum to provide their necessary services
- Any new frequency allocation, any frequency change, or any other basic characteristic of an existing assignment must avoid causing harmful interference to other services

Coordination data file (API or CR) has to be created to follow the interference control mechanism

## Allocation

Frequency are allocated based on the type of services:

- Each frequency band may includes one or more types of radio services
- For the services do not fall into predefined categories are subject of rejection even before the frequency coordination
- The world is divided into three regions, also called ITU regions, and each region has different frequency allocations

## Regulatory Protection

Special regulatory protections are applied for specific applications.

Example

- **Geostationary-satellite is given priority over non-geostationary-satellite**  
Non-geostationary-satellite shall not cause unacceptable interference to and shall not claim protection from geostationary-satellite networks. (Summarized from RR Volume 1, Article 22, 22.2)
- **Data collection systems (DCS) need to have stable regulatory certainty for long-term continuity for its operation**  
The establishment of power limits for earth stations is necessary. (Summarized from RR Volume 3, RESOLUTION 765 and 766 (WRC-15))

### Domestic Radio License - Different condition per country

Example - Japan

- Licensing required per transmitting radio station
  - One license could include several communication ends
  - One satellite license could include multiple ground stations
- Inspection required at beginning but also after defined period of time
- One ground license could include several satellites
- For ground station license,
  - receiving only station does not required to get license
  - ITU coordination is still required on Satellite side targeted to receiving only stations, however
  - The satellite owner/operator and the ground station licensee do not need to be under the same company / individual

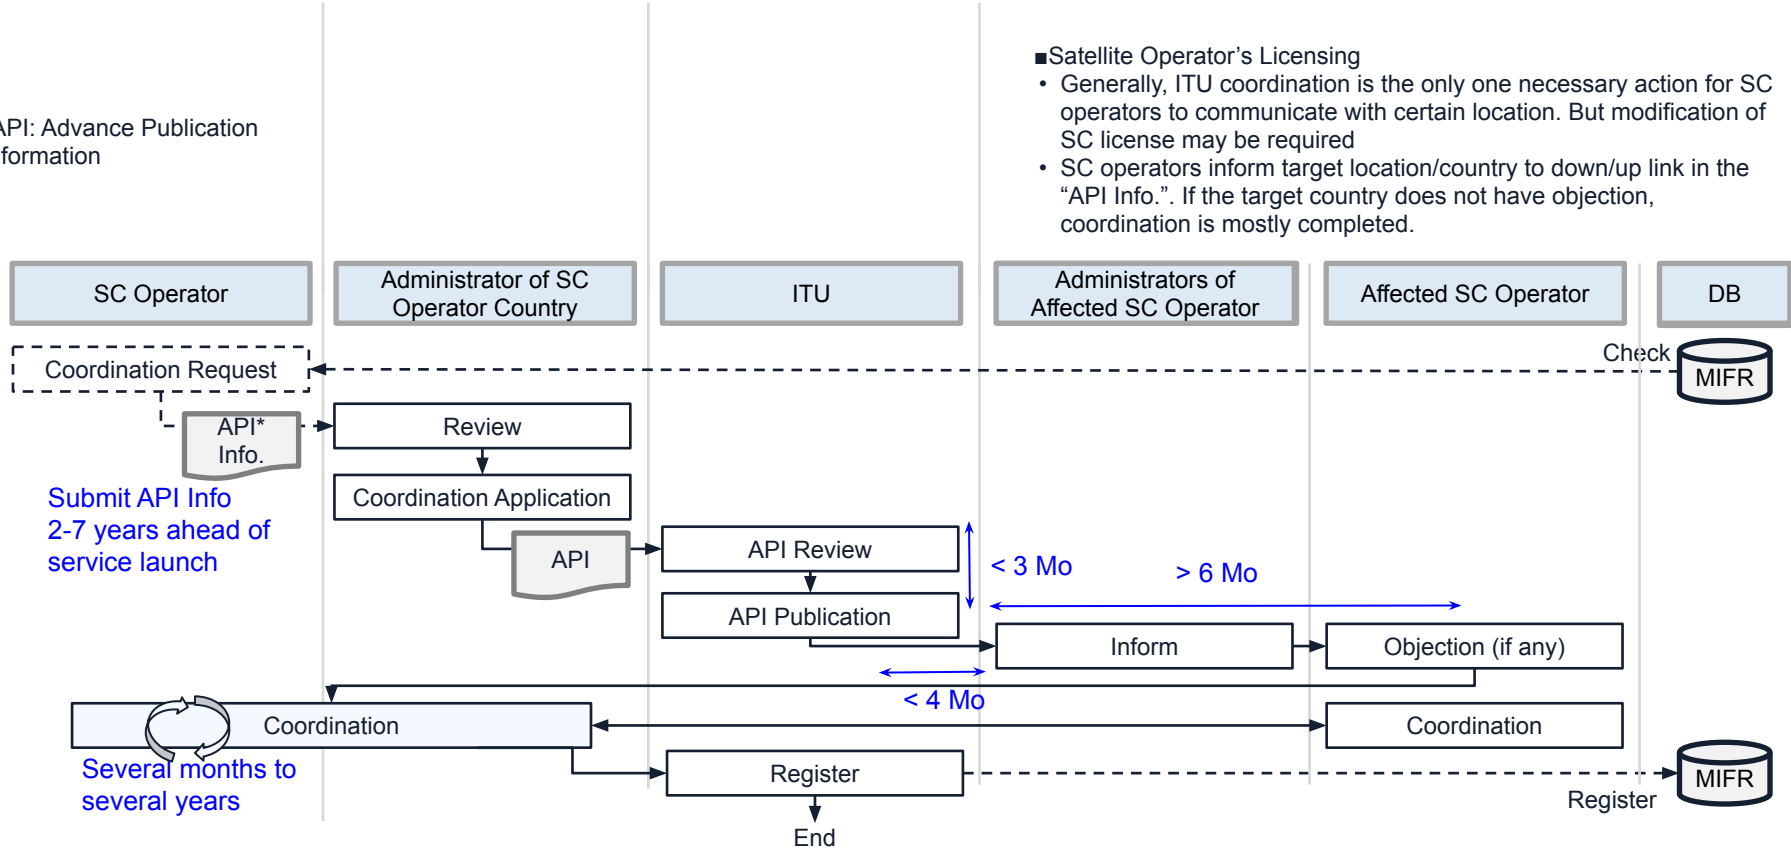

# General ITU Coordination Process

\*API: Advance Publication Information

### ■ Satellite Operator's Licensing

- Generally, ITU coordination is the only one necessary action for SC operators to communicate with certain location. But modification of SC license may be required
- SC operators inform target location/country to down/up link in the "API Info.". If the target country does not have objection, coordination is mostly completed.

ITU Coordination

## Frequency Coordination Service

		Ground Station/ Satellite Operator	Infostellar	Description
Ground Station License	Application, Owning, and Maintenance		Delegate	<ul style="list-style-type: none"> <li>As we provide the available ground station for satellite operators, we obtain and update required ground station license. You don't have care about ground station license.</li> </ul>
Frequency Coordination (ITU Coordination)	Creating an application		Full Support	<ul style="list-style-type: none"> <li>We create an appropriate application document for frequency coordination via ITU by using our experience of the coordination.</li> </ul>
	Negotiation with affected operators		Full Support	<ul style="list-style-type: none"> <li>Frequency coordination requires negotiation with involved operators. We can substitute the whole process leveraging our knowhow.</li> </ul>
	Additional coordination		Full Support	<ul style="list-style-type: none"> <li>When your satellite needs new location to transmit, you have to conduct the coordination. We also support this full process.</li> </ul>
Satellite License	Application, Owning, and Maintenance		Frequency Suggestion	<ul style="list-style-type: none"> <li>We can advice best frequency which is consistent with our ground station network. Please contact us before fixing frequency.</li> </ul>
